Problem Statement

Given a circuit with a 12 V DC source, a 4 Ω resistor, and a parallel branch consisting of a 6 Ω resistor and a capacitor of 100 μ F, find the voltage across the capacitor and the current through it.

Solution Steps

Step 1: Recognize the circuit components and what is asked.

Step 2: Simplify the circuit:

- For DC steady-state, the capacitor acts as an open circuit.
- Therefore, the voltage across the capacitor is the same as the voltage across the parallel branch.

Step 3: Apply circuit laws:

- The resistor and the parallel branch are connected to the 12 V source.
- The current through the resistor is $(I_R = \frac{12V}{4\Omega} = 3A)$.

Step 4: Find the voltage across the parallel branch:

- Since the resistor is directly connected across the source, the voltage across the parallel branch is 12 V.

Step 5: Determine the capacitor voltage:

- The capacitor voltage in steady state is 12 V (since open circuit at DC).

Step 6: Find the current through the capacitor:

- At DC steady state, the capacitor current is zero (since it behaves as an open circuit).

Result:

- Voltage across the capacitor: 12 V
- Current through the capacitor: 0 A

Note: For transient or AC analysis, impedance calculations would be necessary, involving complex analysis as discussed earlier.

Conclusion: Mastering HAYT Drill Problems

Practical Example: Solving a Simple Circuit Problem

Suppose a problem from Hayt involves finding the current in a circuit with a 12 V DC source, a resistor of 4 Ω in series with a 6 Ω resistor, and the task is to determine the current flowing through the circuit.

Step 1: Read the problem carefully.

Given: Voltage source (V) = 12V, Resistors R1=4 Ω , R2=6 Ω .

Required: Total current (I).

Step 2: Draw the circuit diagram.

(Simplified series circuit: Voltage source connected to R1 and R2 in series).

Step 3: Organize data.

Total resistance, $R_{\text{total}} = R1 + R2 = 4\Omega + 6\Omega = 10\Omega$.

Step 4: Apply Ohm's law.

$I = V / R_{\text{total}} = 12V / 10\Omega = 1.2A$.

Step 5: Verify.

The current flows through both resistors equally in series; the voltage drops are $R1I = 4\Omega \cdot 1.2A = 4.8V$ and $R2I = 6\Omega \cdot 1.2A = 7.2V$, summing to 12V, which matches the source.

Step 6: Present the answer.

The current flowing through the circuit is 1.2A.

This straightforward example illustrates the importance of systematic analysis, even in seemingly simple problems.
