Question What is the primary function of cell communication in multicellular organisms? The primary function of cell communication is to coordinate activities between cells, allowing them to respond appropriately to environmental signals and maintain homeostasis. Which molecule acts as a signaling molecule in autocrine signaling? In autocrine signaling, the signaling molecules are often cytokines or growth factors that are secreted by the cell and bind to receptors on the same cell. What role do receptor proteins play in cell communication? Receptor proteins detect signaling molecules (ligands) and initiate a cellular response by activating internal signaling pathways. How do gap junctions facilitate cell communication in animal cells? Gap junctions are channels that directly connect the cytoplasm of adjacent cells, allowing the transfer of ions, nutrients, and signaling molecules for rapid communication. What is the difference between paracrine and endocrine signaling? Paracrine signaling involves local signaling molecules affecting nearby cells, while endocrine signaling involves hormones traveling through the bloodstream to reach target cells at distant sites. Why is signal transduction important in cell communication? Signal transduction amplifies and transmits signals from the cell surface to the interior, leading to specific cellular responses such as gene expression, metabolism changes, or cell division. What is a second messenger, and can you give an example? A second messenger is an intracellular signaling molecule that amplifies the signal received by a receptor. An example is cyclic AMP (cAMP).
